

Molecular Partners AG — Competitive Snapshot

27 May 2026 | Pipeline Intelligence | Confidential

Company Snapshot

Ticker	MOLN.SW (SIX) / MOLN (NASDAQ)
Market Cap	CHF 118M (SIX) / \$152M (NASDAQ)
Cash Position	€78.8M — no acute cash pressure
Annual Burn (EBITDA)	-€51.9M
Cash Runway	~18 months
Debt	€3.3M (near debt-free)
Employees	134
CEO	Patrick Amstutz, Ph.D. (since 2025)
Platform	DARPin therapeutics (engineered repeat proteins ≠ antibodies)
52-Week Range	CHF 2.66 – 3.96 (SIX) / \$3.41 – 5.36 (NASDAQ)
Listing	SIX Swiss Exchange + NASDAQ (dual listing)

Pipeline Overview

Program	Indication	Phase	Status	Modality
MP0533	AML / MDS	Phase 1/2	RECRUITING	Trispecific CD33×CD123×CD70 T-cell Engager
MP0712	SCLC / DLL3+ Tumors	Phase 1/2	RECRUITING	²¹² Pb-Radio-DARPin
MP0317	Biliary Tract Cancer	Phase 2	RECRUITING	FAP×CD40 + Chemoimmunotherapy

Competitive Landscape: AML

17 EU-approved therapies in AML (including Mylotarg, Rydapt, Xospata, Tibsovo, Vanflyta, Vyxeos) — but **no approved multispecific T-cell engager**.

MP0533 occupies a unique position: it is the **first trispecific T-cell engager in clinical trials for AML**, simultaneously addressing CD33, CD123, and CD70. The nearest competitors are bispecific (CD33×CD3 from Amgen, CD123×CD3 from MacroGenics/StemLine). Critically, **Amgen's CD33×CD3 BiTE AMG 330 was terminated** (NCT02520427, Amgen portfolio restructuring, completed Jan 2022) — the competitive landscape is thinner than commonly assumed. MP0533's triple targeting directly addresses antigen escape — the most common resistance mechanism in bispecific T-cell engagers. Preclinical data published in Cancer Immunology Research (2024, PMID: 38683145) demonstrated superior T-cell activation and leukemic stem cell killing vs. bispecific combinations.

3 Key Findings for Dr. Amstutz

Finding 1: Trispecific advantage in a bispecific field

MP0533 is the first and only trispecific T-cell engager in clinical testing for AML (CD33×CD123×CD70). All competitors (Amgen, MacroGenics, StemLine) pursue bispecific approaches. Triple targeting reduces antigen escape — a documented liability for CD33-monetargeting (Mylotarg) and bispecifics. The preclinical publication in Cancer Immunology Research (2024) shows superior in vitro T-cell activation and leukemic stem cell killing vs. bispecific combinations.

Finding 2: Combo strategy with azacitidine/venetoclax opens first-line market access

The Phase 2 extension of NCT05673057 includes combination arms with azacitidine + venetoclax — the current standard of care for unfit AML patients. This positions MP0533 not as a "last resort" monotherapy but early in the treatment cascade. If MP0533 demonstrates an acceptable safety profile in combination (acknowledging that trispecific T-cell engagers carry theoretically higher CRS risk), the addressable market expands significantly beyond R/R monotherapy.

Finding 3: The AML T-cell engager window is narrowing — differentiation timing matters

The competitive landscape is thinner than often assumed. **Amgen terminated its CD33×CD3 BiTE AMG 330** (NCT02520427, portfolio restructuring, Jan 2022) and AMG 673 was also removed from the pipeline. Remaining competitors: MacroGenics' CD123×CD3 DART (flotetuzumab) has Phase 2 data but uncertain development path; StemLine's vibecotamab is in early Phase 1. This means MP0533 faces **less immediate competition than a typical AML landscape would suggest** — but the trispecific complexity story must be clearly communicated to investors and potential partners. The competitor that matters most may not be another T-cell engager, but established AML standards (azacitidine/venetoclax, FLT3 inhibitors, IDH inhibitors) that define the current treatment paradigm.

Near-Term Catalysts

Catalyst	Expected	Significance
MP0533 Phase 1 dose-finding — initial safety data	H2 2026	First clinical data for trispecific T-cell engager in AML; DARPin trispecific platform PoC
MP0712 (²¹² Pb-DARPin) First Patient Dosed	Q3 2026	Start of radioligand DARPin era; DLL3 dose-finding begins
MP0317 TACTIC Phase 2 interim readout	2027	12-month PFS in BTC; FAP×CD40 DARPin PoC

Competitive Positioning Map: AML T-Cell Engagers

Target	Drug	Company	Modality	Phase	Strategy
CD33×CD123×CD70	MP0533	Molecular Partners	Trispecific DARPin	Ph1/2	Antigen escape protection
CD33×CD3	AMG 330	Amgen	BiTE (bispecific)	✗ Terminated	Amgen portfolio restructure
CD33×CD3	AMG 673	Amgen	BiTE (half-life ext.)	✗ Removed	Removed from pipeline
CD123×CD3	Flotetuzumab	MacroGenics	DART (bispecific)	Ph1/2	CD123 targeting
CD123×CD3	Vibecotamab	StemLine/Xencor	Bispecific mAb	Ph1	CD123 targeting
CD33	Mylotarg	Pfizer	ADC	✓ Approved	CD33 ADC (not T-cell)

Financial Context

Metric	Value	Assessment
Cash	€78.8M	~18 months runway — no urgent financing pressure
Annual Burn	-€51.9M	Funding three active Ph1/2 trials
Dual Listing	SIX + NASDAQ	US capital markets accessible — no reverse-IPO needed
Platform Deal History	Multiple partnerships	Amgen (2013, \$57M upfront + milestones), Novartis, Allergan — platform licensing track record

Outreach framing: Molecular Partners is not a distress story. With ~18 months of cash, three actively recruiting Phase 1/2 trials, and a differentiated DARPin platform with partnered validation, the value proposition is platform differentiation — not financial urgency. The outreach should focus on the trispecific advantage in AML, not on cash pressure.
